Weather API Properties Filter Bug Fixes

Today's release includes two bug fixes when using the `?properties=` query string parameter to filter out properties, in the Weather Observations and Weather Norms APIs.

Weather Observations

When the `?properties=` query string parameter is used, the `date` property is now always included in the results (it cannot be filtered out). This makes sure that the ranged results are unambiguous. Example:

```
https://api.awhere.com/v2/weather/fields/field1/observations?properties=precipitation
```

Weather Norms

The `?properties=` query string parameter now correctly filters out other properties. Previously, the optional parameter had no effect on the results. Example:

```
https://api.awhere.com/v2/weather/fields/field1/norms/08-01,08-15?properties=meanTemp
```
